ASYNCHRONOUS GROUP ACTIVITY
Project Development – Initial System Implementation
Course: C-CTESOFTDEV3 – Software Development 3

OBJECTIVE
In this activity, your group will officially begin the development and coding phase of your approved software project.

Your group will start translating your proposed system designs and planned features into an actual working application, including both frontend and backend development.

The goal of this activity is to establish your project's initial structure, begin implementing the core features of your system, and demonstrate measurable development progress.

By the end of the activity, your group should have an initial working version of its application that can be presented during our next class meeting.

TECHNOLOGY REQUIREMENTS
Your group may choose the technologies that best suit your proposed system, subject to the following requirements:

Frontend Development
Choose one of the following frameworks:
- React.js
- Next.js
- Vue.js

Backend Development
Your group has the freedom to choose its preferred backend technology, such as:
- Node.js
- Express.js.

Database
You may also select your preferred database management system based on your project's requirements. Make sure that your chosen technologies are appropriate for your system and manageable for your group.

GENERAL INSTRUCTIONS
1. Each group must begin the actual development of its approved software project.
2. Select your preferred frontend framework from the provided options and decide on the backend technology and database you will use.
3. Set up your development environment and establish a proper project structure for both frontend and backend.
4. Start converting your proposed UI designs or Figma prototypes into actual application pages and components.
5. Begin developing the backend structure of your system, including the necessary routes, APIs, database models, or other components relevant to your project.
6. Focus on implementing the initial core features of your system. You are not expected to complete the entire application at this stage.

7. Establish basic communication between your frontend and backend, if applicable. You may begin with a simple API request or a basic data retrieval operation.
8. Make sure that your application can run locally and demonstrate the features or components you have started developing.
9. Divide development tasks among group members to ensure that everyone has a clear responsibility and contribution.
10. Be prepared to present your initial development progress on Monday, November 9, 2026. Each group must have actual coding progress to demonstrate during class.

EXPECTED OUTPUT FOR MONDAY
Each group must be able to demonstrate the following:

1. Project Setup and Technology Stack
- Selected frontend framework, backend technology, and database
- Properly initialized development environment
- Organized project structure

2. Initial Frontend Development
- At least 2–3 implemented pages or major UI sections based on your proposed system
- Basic navigation and UI interactions

3. Initial Backend Development
- Initial backend project setup
- At least one working API endpoint, route, or backend functionality
- Initial database setup or data models, if applicable

4. Initial System Integration
- Demonstrate at least one basic interaction between your frontend and backend, such as retrieving and displaying sample data.

5. Development Progress
- Brief explanation of completed tasks
- Individual contributions of group members
- Challenges encountered during development
- Planned features and next development steps

PROGRESS PRESENTATION
During our Monday class, each group will briefly present its current development progress.

Your presentation should include a live demonstration of your application, showing the frontend pages and backend functionality you have implemented so far.

Be ready to explain your chosen technology stack, current development progress, individual task assignments, and any challenges encountered.

You do not need to prepare a lengthy PowerPoint presentation. The focus will be on your actual application and coding progress.

REMINDER

This activity marks the beginning of your project's actual implementation phase. You are no longer working solely on proposals, wireframes, or prototypes.

Make sure that your group has started coding and has something functional to present on Monday. A Figma design, static screenshot, or project proposal alone will not be considered sufficient development progress.

Your system does not need to be complete yet. However, your group should be able to demonstrate actual progress in both frontend and backend development.

Focus on building a working foundation for your system rather than attempting to complete all features immediately.

Use your time wisely, distribute tasks properly, and coordinate with your group members to ensure that everyone contributes.

See you on Monday, and good luck with your development!
